Partnerships Award (SEPA). The content is broken into four modules: Hallmarks of Cancer emphasizes cancer as a genetic disease and highlights the common features or "hallmarks" of a cancer cell. Causes & Prevention uses epidemiological data to highlight behaviors and environmental factors that increase cancer risk, and examines the molecular mechanisms that lead to cancer development.

Inside Cancer - Hallmarks to cancer: Growing uncontrollably

The hallmarks of cancer comprise six biological capabilities acquired during the multistep development of human tumors. The hallmarks constitute an organizing principle for rationalizing the complexities of neoplastic disease. They include sustaining proliferative signaling, evading growth suppressors, resisting cell death, enabling replicative immortality, inducing angiogenesis, and activating invasion and metastasis. Underlying these hallmarks are genome instability, which generates the

Cancer. Lying dormant in our genomes are millions of jumping genes. Originally discovered by Barbara McClintock, transposons are DNA sequences that can move from one location to another in our DNA. Transposons cause mutations when they jump to new locations, so keeping them from jumping is important.
