The objectives of the study were to undertake phenotypic characterization of indigenous goat type found in the study area under farmers' management condition and to develop equation for prediction of body weight by using linear body measurements. A total of 600 goats were sampled randomly for characterization of phenotypic traits.

Indigenous goat populations generally dominate the goat flocks in Ethiopia and have developed certain valuable genetic traits such as ability to perform better under low input condition and climatic stress, tolerance to infectious diseases and parasites as well as heat stresses (Philipsson et al., 2006; Kosgey and Okeyo, 2007).

"The Global Plan of Action for Animal Genetic Resources, adopted in 2007, is the first internationally agreed framework for the management of biodiversity in the livestock sector. It calls for the development of technical guidelines to support countries in their implementation efforts. Guidelines on the Preparation of national strategies and action plans for animal genetic resources were published by FAO in 2009 and are being complemented by a series of guideline publications addressing specific technical subjects. These guidelines on Phenotypic characterization of animal genetic resources address Strategic Priority Area 1 of the Global Plan of Action --- "Characterization, inventory and monitoring of trends and associated risks". They complement, in particular, the guidelines on molecular genetic characterization and on surveying and monitoring of animal genetic resources. They have been endorsed by the Commission on Genetic Resources for Food and Agriculture. The guidelines offer advice on how to conduct a well-

targeted and cost-effective phenotypic characterization study that contributes to the improvement of animal genetic resources management in the context of country-level implementation of the Global Plan of Action. An overview of the concepts and approaches that underpin phenotypic characterization is followed by practical guidance on planning and implementing field work, data management and data analysis. The annexes include generic data collection formats for phenotypic characterization of major livestock species, as well as a framework for recording data on breeds' production environments."--Publisher's description

Goat science covers quite a wide range and varieties of topics, from genetics and breeding, via nutrition, production systems, reproduction, milk and meat production, animal health and parasitism, etc., up to the effects of goat products on human health. In this book, several parts of them are presented within 18 different chapters. Molecular genetics and genetic improvement of goats are the new approaches of goat development. Several factors affect the passage rate of digesta in goats, but for diet properties, goats are similar to other ruminants. Iodine deficiency in goats could be dangerous. Assisted reproduction techniques have similar importance in goats like in other ruminants. Milk and meat production traits of goats are almost equally important and have significant positive impacts on human health. Many factors affect the health of goats, heat stress being of increasing importance. Production systems could modify all of the abovementioned characteristics of goats.

This book provides an overview of developments in the conservation and sustainable utilisation of Farm Animal Genetic Resources. It is based on presentations given at a conference on this subject co-organised by the British Society of Animal Science, the Department for Environment, Food and Rural Affairs, the Rare Breeds Survival Trust and the Sheep Trust.

"Animal breeders and veterinarians have become increasingly interested in breeding strategies aimed at improving disease resistance in farm animals, as this lessens farmers' dependence on the use of drugs at a time when there is concern about their high usage in animals to be used for food products. There has also been concern at the level of drug resistance now shown by many disease organisms, and the cost of veterinary drugs in developing countries. This book consists of 27 chapters by leading international research workers from the UK, USA, Canada, Europe, Africa and Australasia reviewing our current knowledge in this area, and should interest workers in animal breeding and genetics, parasitology, animal production and veterinary medicine."--BOOK JACKET. This book explores the current trends and challenges of sustainable goat meat and milk production in different global contexts, providing valuable insights into this industry in adverse environments like mountain, semiarid and arid regions. It also includes contributions from international experts discussing goat reproduction, genetic diversity and improvement, as well topics such as animal health, welfare, socioeconomic aspects, and many other issues regarding the environmentally friendly and economically viable exploitation of goats. This is a highly informative book providing scientific insight for readers with an

interest in sustainable agriculture and socio-economic aspects, as well as goat breed conservation, genetic diversity, and veterinary care. These subjects are complemented in a second volume providing a detailed description of more than 40 indigenous goat breeds and several ecotypes found in Asia, Africa, Europe, and America.

Microsatellite or so-called simple sequence repeat (SSR) markers have been one of the most reliable molecular markers derived from the DNA molecule, which were widely and successfully used for more than 25 years in the genetic studies of environmental, agricultural, and biomedical sciences. The objective of this Microsatellite Markers book is to rehighlight and provide some updates on previous and recent utilization of microsatellite markers for various applications in agriculture and medicine, which void emerging opinion on "full death" of microsatellites as useful genetic markers. Chapters presented here demonstrate the future benefit of SSRs in many genetic studies as well as disease diagnosis and prognosis.
