Following are the
main operations of
transaction:

Read(X): Read operation is used to read the value of X from the database and stores it in a buffer in main memory. Write(X): Write operation is used to write the value back to the database from the buffer. Let's take an example to debit transaction from an

concept emerges
with the following
properties:

Consistency: the
transaction must
obey legal
protocols.

Atomicity: it either
happens or it does
not; either all are

bound by the contract or none are. Durability: once a transaction is committed, it cannot be abrogated.
